CAMPUSCYCLE

CampusCycle Feature List — Updated

A university resource-sharing marketplace — buy, sell, rent, lend, donate, and discover campus resources, with human-first reporting, moderation, and support workflows.

1. User & Account Management

- Student registration using college/university email.
- Student verification and verified-user badge.
- University-exclusive community.
- Profile with listings, transactions, requests, followed tags/domains, ratings/reputation, and relevant account status.

2. Resource Listing

- Listing types: Sell, Rent, Lend, Donate.
- Listing information: item name, photos, description, condition, price, rent price/duration, availability, pickup location, domain, category, and tags.

3. Buy & Sell

- Seller: create listing, set price, edit listing, mark as sold, manage interested users.
- Buyer: search, view listing, contact seller, negotiate, reserve, complete transaction.

4. Rental System

- Seller/lender can set rental price, duration, availability dates, and optional deposit.
- Student can request rental, select duration, reserve, return item, and confirm completion.

5. Borrow & Lend

- For situations where money is not necessarily involved. Student requests an item, owner approves, item is borrowed, returned, and both confirm.

6. Donation

- Students can give resources away instead of selling them, with donation listing and claim/history support.

7. Resource Request System

- Students can state: I NEED this resource, including purpose, required date, duration, and request status.
- Request remains active until fulfilled, cancelled, or expired.

8. Tag System

- Resources can have relevant tags. Users can search tags, browse tags, follow tags, and use tags in requests.

9. Follow / Adopt a Tag

- Students can follow a tag when no listing currently exists. When a matching listing appears, the system sends a notification.

10. Automatic Tag Association

- The system can associate related tags with selected items/categories while allowing additional relevant tags.

11. Domains

- Academics; Projects & Electronics; Hostel & Campus Life; Sports & Fitness; Other Student Resources.

12. Domain → Category → Item → Tags

- Structured hierarchy for resource organization and discovery.

13. Search & Discovery

- Keywords, tags, categories, domains, and filters for buy/rent/borrow/donate, price, condition, availability, and location.

14. Recommendations

- Related resources based on domain/category/resource relationships. Initially rule-based where appropriate.

15. Resource Ecosystems

- Represent groups of resources commonly used together, such as Arduino → breadboard → jumper wires → sensors → USB cable.

16. Wishlist

- Students save resources and receive notifications when appropriate listings appear.

17. Notifications

- Followed tag becomes available; requested item becomes available; wishlist item appears; responses/messages; rental period approaching; return due; transaction status changes.

18. In-App Messaging

- Buyer ↔ Seller, Borrower ↔ Lender, Requester ↔ Resource owner.
- Used for questions, negotiation, pickup arrangements, and rental details.
- Users can report an individual message from the chat.

19. Reservation

- Students can temporarily reserve an item to prevent multiple people from assuming they have secured it.

20. Campus Pickup

- Predefined campus locations such as Library, Academic Block, Hostel Gate, and Cafeteria can support exchanges.

21. Rating & Reputation

- Buyer can rate seller; seller can rate buyer; borrower can rate lender; lender can rate borrower.
- Possible metrics: overall rating, successful exchanges, response rate, completed rentals, completed donations.

22. Reporting & Human Moderation

- **Report listing/post:** users can report fake, misleading, abusive, inappropriate, suspicious, prohibited, or spam content.
- **Report message:** users can select an individual chat message and report it.
- **Report user:** users can report suspicious or problematic users.
- **Reason selection:** harassment/abuse, threatening behavior, scam/fraud, prohibited content/item, spam, inappropriate content, or other.

- **Optional explanation:** reporter can describe why the content is problematic.
- **Context:** message reports should include the reported message and relevant surrounding conversation context for review.
- **Human review:** reports enter a moderator queue rather than causing automatic punishment based solely on a keyword.
- **Report states:** Pending → Under Review → Resolved or Dismissed.
- **Moderator actions:** dismiss, warn, remove content, restrict features, temporarily suspend, or permanently suspend.
- **Moderation history:** store the decision, action, moderator, reason, and timestamp.
- **Principle:** moderators consider context because the same sentence can be harmless in one conversation and threatening in another.

23. Admin / Moderator Dashboard

- Users: view users, verify users, suspend/restrict users where appropriate.
- Listings: remove inappropriate listings, manage categories/domains/tags.
- Reports: review, prioritize, investigate, resolve, or dismiss reports.
- Moderation: view evidence/context, apply actions, and view moderation history.
- Requests: monitor activity.
- Tickets: review, assign, investigate, and resolve support tickets.

24. Support Ticket System

- Separate from content reports and used for broader problems requiring investigation.
- Examples: transaction/payment or delivery dispute, account problem, moderation appeal, repeated harassment, or general complaint.
- Ticket fields can include category, description, attachments/evidence, status, assigned moderator/support person, messages, and resolution.
- Suggested states: Open → In Review → Waiting for User / Waiting for Action → Resolved → Closed.

25. Demand–Supply Analytics

- Track demand against supply to identify high-demand / low-supply resources and categories.

26. Sustainability Dashboard

- Resources reused, items donated, items rented, successful exchanges, estimated student savings, and most reused categories.

27. Activity / Transaction History

- Users can see items bought, sold, rented, borrowed, donated, and requests fulfilled.

28. Status Tracking

- Items: Available, Reserved, Sold, Rented, Borrowed, Donated, Unavailable.
- Requests: Active, Matched, Fulfilled, Expired, Cancelled.
- Reports: Pending, Under Review, Resolved, Dismissed.

• Tickets: Open, In Review, Waiting, Resolved, Closed.

29. Overall Concept

At this point, CampusCycle can be described as connected systems working together:

SUPPLY → DEMAND → DISCOVERY → MATCHING → EXCHANGE / RENTAL → RATING & HISTORY → ANALYTICS

Across the exchange layer, a separate Trust, Safety & Support layer handles reports, human moderator review, moderation actions, support tickets, appeals, and audit history.

30. Priority Levels

Priority	Features
Core / MVP	Student verification, profiles, domains/categories, listings, buy/sell, rent, borrow/lend, donate, search, tags, requests, follow tags, notifications, messaging, reservations, ratings, reporting, human moderation/review, moderator/admin dashboard, moderation actions/history, and support tickets.
Advanced	Recommendations, resource ecosystems, automatic tag association, wishlist, demand/supply analytics, sustainability dashboard, richer campus pickup workflows.
Future	Personalized recommendation engine, ML-based demand prediction, AI-assisted moderation pre-screening, AI image/category detection, inter-college exchange, advanced impact estimation, mobile application, and other research-dependent capabilities.

Moderation decision: the MVP is human-first. Users report problematic content or behavior, assigned moderators review the evidence and context, and the system records the outcome. AI is a future supporting layer rather than a prerequisite for the initial moderation system.
